Lesson 13: Frames

13.1 Introduction to Frames

This lesson looks at the concept of frames that is supported by many browsers and is commonly used in web sites.

13.2 Frame Documents

A frame document is a web document which specifies the size and shape of each of the frames on the web page. The frame document also specifies the name and location of the web page to be displayed in each of the frames. A frame document has a basic structure as shown below:

```
<HTML>
    <HEAD>
   </HEAD>
  <FRAMESET>
  </FRAMESET>
</HTML>
```

13.3 Basic Frame Elements

The <FRAMESET>…</FRAMESET> element is used to define the start and end of a frame container. The <FRAMESET> element has two attributes. ROWS and COLS. These attributes take a comma separated list of values in quotation marks. These attributes can be in absolute pixels or in percentages between 1% - 100%. The special character * can be used to denote a relative sized frame (the remaining space to the frame).

However, before we can illustrate the use of the <FRAMESET> element we need to be able to define the URL address of the pages which are to be displayed with these frames. The <FRAME> element is used to define a single frame within a <FRAMESET>. The <FRAME> element may occur only inside <FRAMESET> elements.
The <FRAME> element has six attributed:

a. SRC define the URL of the web page to be displayed.
b. NAME allows an individual frame to be named.
c. MARGINWIDTH and MARGINHEIGHT allows space between images and text within a frame and frame boundary to be adjusted.
d. SCROLLING determines whether a window will be allowed to be scrolled when its contents are displayed.
e. NORESIZE specifies that the user cannot resize the frames by dragging a frame edge to a new position.

13.4 Column Frames

```
<HTML>
  <HEAD> <!—Example of column frames-->
  </HEAD>
<frameset cols="100,60%,*">
<NOFRAMES>
```

```
   This document uses frames
</NOFRAMES>
   <frame SRC="location and file name" SCROLLING=NO>
    <frame SRC="location and file name"NORESIZE>
<frame SRC="location and file name">
</frameset>

</HTML>
```

13.5 Row Frames

```
<HTML>
  <HEAD> <!—Example of Row frames-->
  </HEAD>
<frameset ROWS="100,60%,*">
<NOFRAMES>
   This document uses frames
</NOFRAMES>
   <frame SRC="location and file name" SCROLLING=NO>
    <frame SRC="location and file name"NORESIZE>
<frame SRC="location and file name">
</frameset>

</HTML>
```

13.6 Combining Column and Row Frames

```
<HTML>
  <HEAD> <!—Example of Row frames-->
  </HEAD>
<frameset COLS="40%,*">
<NOFRAMES>
   This document uses frames
</NOFRAMES>
   <frame SRC="location and file name">
    <frameset ROWS="20%,*">
<frame SRC="location and file name">
</frameset>

</HTML>
```

13.7 Exercise

1. Write a set of frames to show your bio-data in a colourful form with suitable links

2. Write a few HTML documents each explaining about a district or county you belong to. The list of districts must appear in a frame. When you click on a district, the details must appear in another frame.
