Lesson 10: Hyperlinks

10.1 Introduction to Hyperlinks

This section of the course will examine some of the features of hypertext links and how these can be combined with graphical images.

10.2 Internal Hyperlinks

Assign location name to individual point in an HTML file
Location name can then be added to the page's URL
Link to specific point on the page
Location marked by including a NAME attribute in an A (anchor) element
Ex. <A NAME = "features"></A> in list.html
URL of location
Format: page.html#name
Ex. list.html#features

A hot text is created with an anchor tag <A>text</A>.
Format: <A HREF="college.html">St Xavier's College</A>

10.3 External Hyperlinks

<A HREF> is used to connect to an external link.

10.4 An external Hyperlinks to an existing web page

It is possible to create hyperlinks to pages on other servers. This allows you to share the resources and information already available on other internet sites. The element <A> is used with attribute HREF to form a link to an existing web site page.
Format: <A HREF="location and name">…</A>

10.5 In-Line Images as Links

The <A> text </A> hyperlink element is placed around text in order to form a hypertext link. Clicking on the image will result in the hyperlink being activated.
Format: <A HREF="location and file name"><IMG SRC="name and location"></A>

10.6 Hyperlinks to Mail Dialogues

The <A> element can link to mail tool instead of another web page.
Format: <A HREF=mailto:name@location>….</A>

10.7 Hyperlinks to Newsgroup Dialogues

The <A> hyperlink element can link to a newsgroup dialogue, instead of another web page.
Format: <A HREF=news:news.group>…..</A>

10.8 Hyperlinks to Files

Hyperlinks can point to files on a server as well as web pages, mail and news group tools.
Format: <A HREF="/directory/myprog.exe">

10.9 Embedding Files

The <EMBED> element allows you to embed document of any type into the page.

Format: <EMBED SRC=”location and name”>
<EMBED SRC=”location and name” HEIGHT=num1 WIDTH=num2>

10.10 Clickable Maps

A clickable map is the name given to an in-line image which has been defined as a clickable region. ISMAP is added to make the image clickable.
Format: <IMG SRC=”name and location” ISMAP>

10.22 Creating and Using Image Maps

- *Image maps*
  - Designate certain sections of an image as *hotspots*
  - Use hotspots as anchors for linking
  - All elements of image map inside **<MAP>**…**</MAP>** tags
  - **<MAP>** tag requires **NAME** attribute
    - Ex. **<MAP NAME = “picture”>**
- Hotspots designated with **AREA** element
  - **AREA** attributes:
    - **HREF** sets the target for the link on that spot
    - **SHAPE** and **COORDS** set the characteristics of the **AREA**

ALT provides alternate textual description

10.23 Exercise

Write the names of several countries in a paragraph and store it as an HTML document, “world.html”. Each continents name must be a hot text. When you click Europe, it should open a file called “Europe.html”. So prepare “Europe.html”,” America.html”, “Africa.html”,” Asia.html” and “Australia.html”. Each of the HTML documents must give a brief introduction of the continent and list a few important countries in it. Each country’s name must be a hot text. When you click India (for example), it must open “India.html”
